The Political Geography of Metropolitan Detroit

Geopolitical Cross-Pressures in Metropolitan Detroit

Distressed Central Cities

- Social Racial Pressures 
- Economic Pressures 

Threatened Suburbs

- Social Racial Pressures 
- Economic Pressures 

Advantaged Suburbs

- Social Racial Pressures 
- Economic Pressures 

Selection Criteria

For Detroit Area Geopolitical Categories

Primary Categories:

	1990 Municipal median household income as percentage of MSA	1990 Municipal median specified owner-occupied house value as percentage of MSA (Relative Market Position)	1980-1990 change in relative market position	1990 Percentage of residents that are black persons	1990 Municipal poverty rate for all persons	Municipal model housing construction decade
Distressed Central Urban Places	Below 75%	Below 75%	Decline	Greater than 15%	Greater than 20%	Earlier than 1950s
Threatened White Working-Class Places	75% - 110%	75% - 110%	Decline	Less than 15%	Less than 20%	1950s
Middle-Class Places	Greater than 110 % less than 145%	Greater than 110% less than 145%	Increase	Less than 10%	Less than 5%	1950s or later
Wealthy Places	Equal to or greater than 145%	Equal to or greater than 145%	Increase	Less than 10%	Less than 5%	Not specified

Secondary / Residual Categories:

Distressed White Places:

These places meet the criteria for *Distressed Central Urban Places* except that their percentage of residents that are black persons is less than 15%. (Only Hamtramck fits this category.)

Threatened Transitional Places:

These places meet the criteria for *Threatened White Working-Class Places* except that their percentage of residents that are black persons is greater than 15%. (Mount Clemens, Oak Park, and Romulus fit this category.)

Middle-Class Transitional Places:

These places meet the criteria for *Middle-Class Places* except that their percentage of residents that are black persons is greater than 10%. (Only Southfield fits this category.)

Notes:

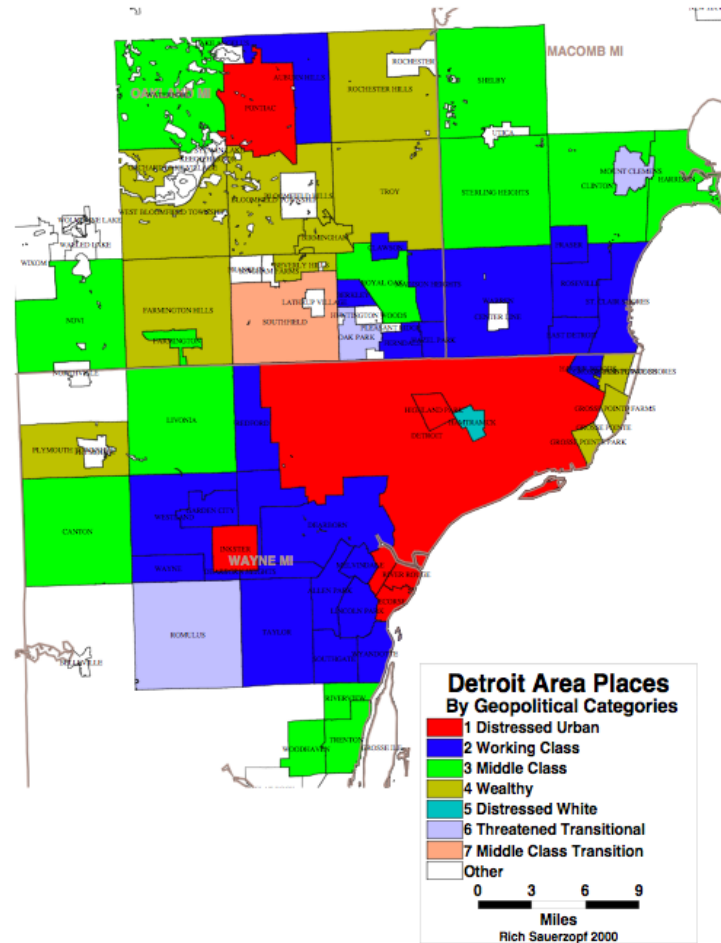

For a place to be defined by one of the primary categories, it may fail to meet one of the specified criteria except *percentage of residents that are black persons*.

The same standard is applied to the residual categories. That is, while they failed to meet *the percentage of residents that are black persons* criterion for their respective primary category, they may have failed to meet *another* primary criterion also.

For some municipalities, *change in relative market position* figures are unavailable. This is generally the case for the "new" fast growing cities and townships on the metropolitan area's edge. Most of these places are categorized as *middle-class* or *wealthy* places based on other criteria with the assumption that their relative market position increased during that decade.

Richard Sauerzopf, 2009

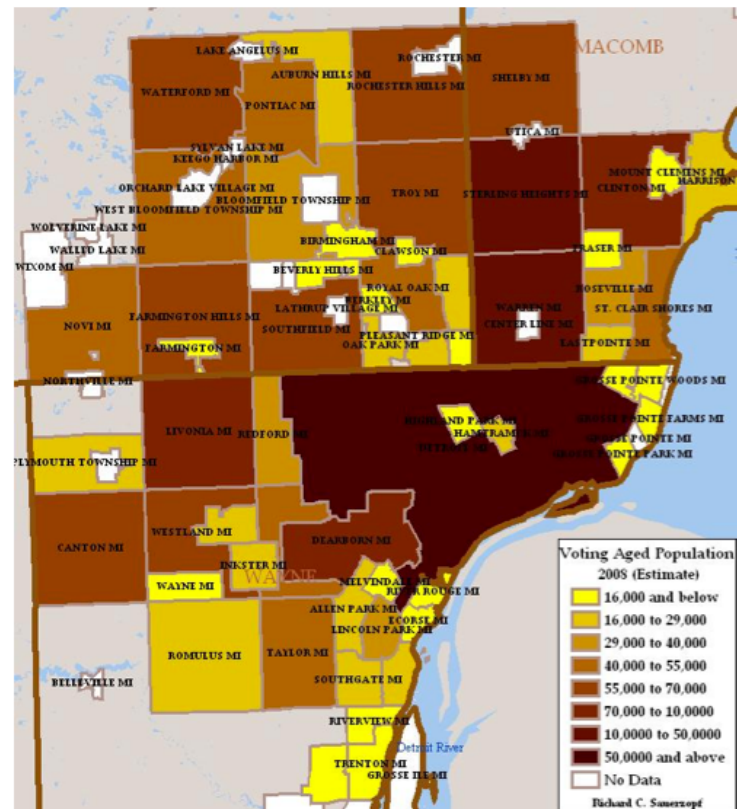

Detroit Area Places By Geopolitical Category

Detroit Area Electorates

Potential Electorates

Total Voting Aged Populations, Estimated for Selected Places 2008

Potential Electorates

Total Voting Aged Populations for Sample places, By Category, By Election

Note: Top figure illustrates total voting aged population figures for selected Detroit area places, by election, summed by category. The lower figure compares these same totals as they are proportional to the total potential electorate for all sample places defined by the above (major) categories. Voting aged population figures are based on linear extrapolations of data between decennial Census reports. Voting aged population figures for 2004 and 2008 are estimated by continuing the 1990-2000 proportion.

Actual Electorates

Total Presidential Electorates for Sample places, By Category, By Election

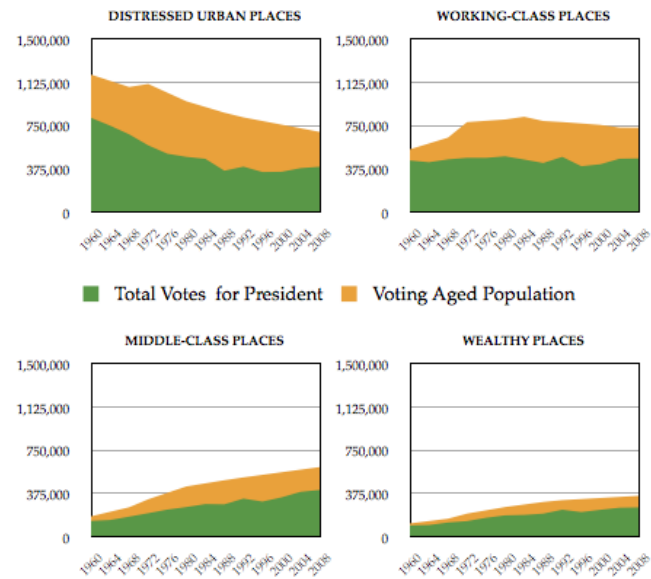

Note: Top figure illustrates total votes for presidential candidates from selected Detroit-area places, by election, summed by each of the major geopolitical categories. The lower figure compares these same totals as they are proportional to the total number of votes for presidential candidates summed for all sample places defined by the above (major) categories.

Richard Sauerzopf, 2009

Comparative Electorates

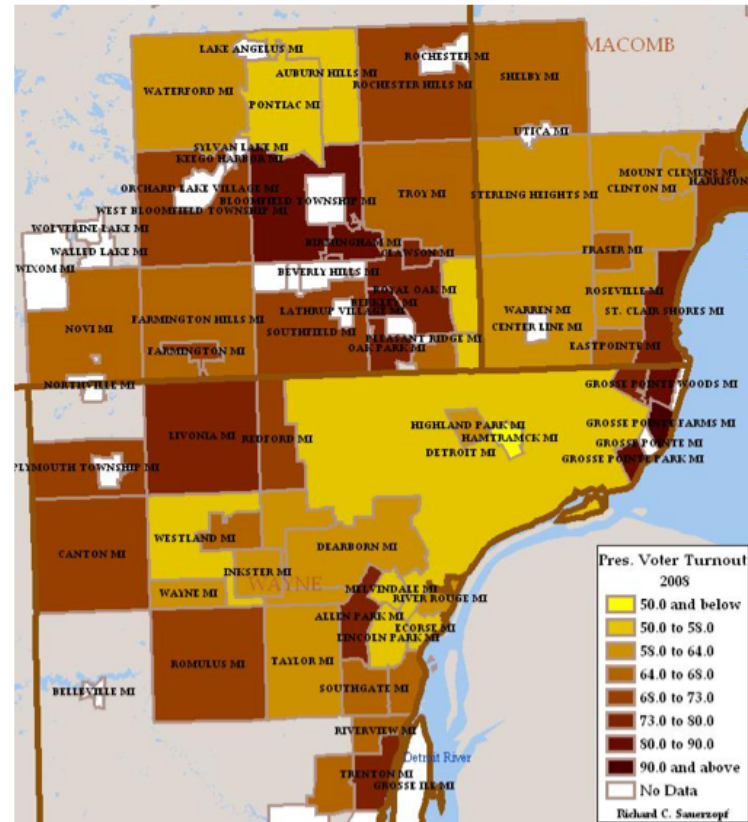

Comparative Potential and Actual Presidential Electorates for Selected Detroit Area Places, By Category

Note: These four figures illustrate potential electorates (voting aged populations) in comparison to actual presidential electorates (total votes for president) for selected Detroit area places, summed by the four primary geopolitical categories. Voting aged population figures are based on linear extrapolations between data from decennial Census reports. Voting aged population figures for 2004 and 2008 are estimated by continuing the 1990-2000 projection.

Voter Turnout

Presidential Voter Turnout for Selected Detroit Area Places 2008

Voter Turnout

Voter Turnout in Presidential Elections for Selected Detroit Area Places, By Category

Note: Figure illustrates voter turnout rates for Detroit area places by category. Turnouts are calculated with pooled statistics for each category. Voting aged population figures are based on linear extrapolations between data from decennial Census reports. Voting aged population figures for 2004 and 2008 are estimated by continuing the 1990-2000 projection.

Richard Sauerzopf, 2009

Adjusted Voter Turnout

Voter Turnout in Presidential elections for Selected Detroit Area Places, By Category, Shown Proportional to Michigan State Voter Turnouts.

Notes: Figure illustrates voter turnout rates for selected Detroit area places, pooled by category and calculated as they are proportional to Michigan turnout rates. Here, the base figure for the adjusted turnout rate is 1. A category turnout for a given year greater than 1 indicates that voters from places in that category voted at a higher rate than Michigan's voters as a whole while an adjusted turnout of less than one means the opposite. Turnouts are calculated with pooled statistics for each category that compare total votes for president as percentages of voting aged population estimates. Voting aged population figures are based on linear extrapolations between data from decennial Census reports. Voting aged population figures for 2004 and 2008 are estimated by continuing the 1990-2000 projection. The Adjusted Voter Turnout Rate for a pooled category constituency can be reduced to the following:

$$\frac{\text{Category Voter Turnout}}{\text{Michigan State Voter Turnout}}$$

Nardulli, Delage, and Croso use a similar measure. Nardulli et al. 1996.

Richard Sauerzopf, 2009

The Partisan Geography of Metropolitan Detroit

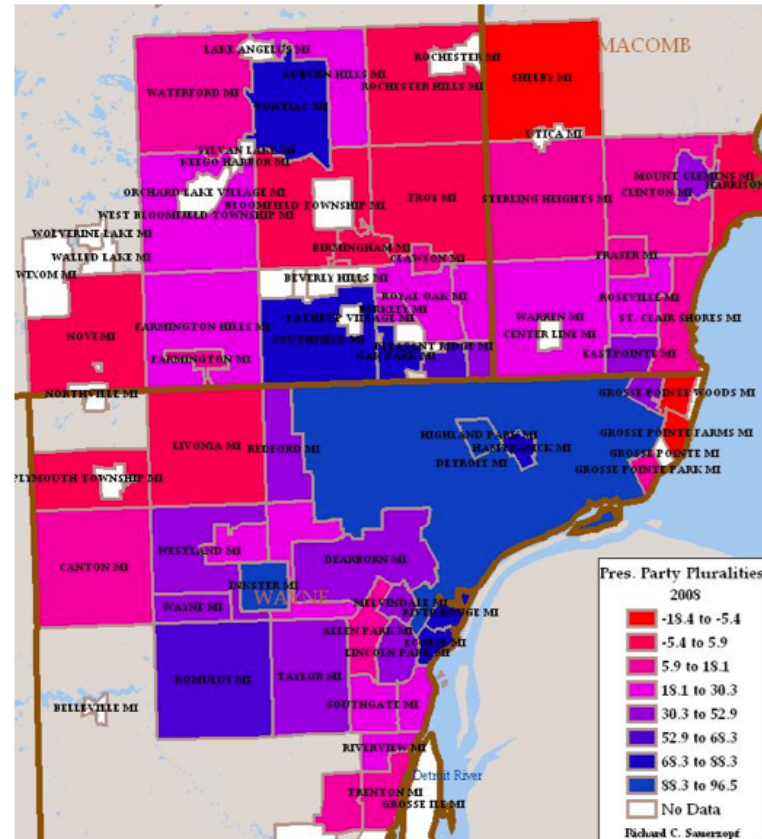

Votes for Presidential Candidates

Total Votes for Presidential Candidates, by Party, for
Selected Detroit Area Places, by Category

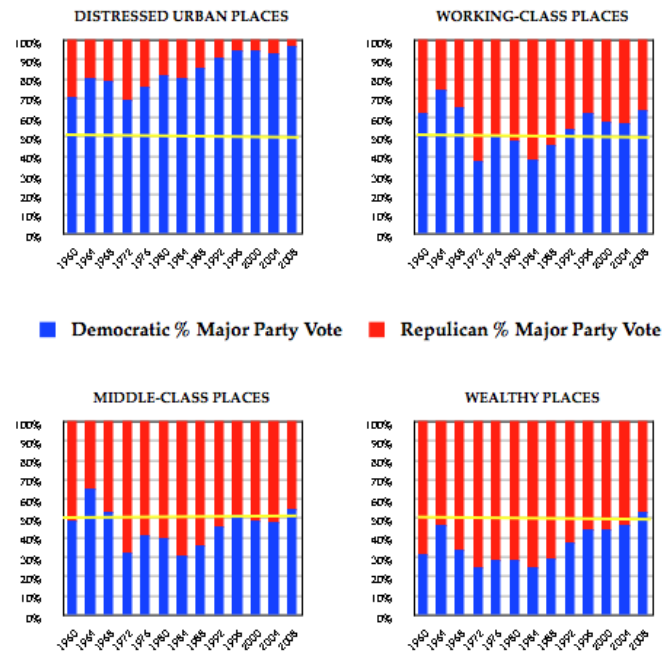

Notes: Third party totals are for Wallace in 1968, Perot in 1992 and 1996, and Nader in 2000, 2004, 2008. Votes for Anderson in 1980 were not segregated in the data base from votes for "other" candidates.

Presidential Party Pluralities For Selected Detroit Area Places 2008

Party Percent of Major Party Votes

Partisan Percentage of Major Party (Democratic and Republican) Votes for
Presidential Candidates for Selected Detroit Area Places, by Category

Presidential Party Pluralities

Percentage Party Pluralities for Selected Detroit Area Places, By Category

Note: Percentage presidential party pluralities are calculated for pooled category constituencies. That is, votes for president from selected sample places are summed by category then percentage plurality figures for each category are determined from pooled statistics. Percent party plurality is calculated as the percentage of the total major party votes for president (all votes for the Democratic and Republican candidates) that went to the Democratic candidate minus those that went for the Republican candidate. Therefore, positive figures on the graph represent a margin of Democratic support from a given pooled constituency whereas negative figures represent a margin of support for Republican candidates. As such, the graph indicates the direction and intensity of support for candidates by party over time.

Richard Sauerzopf, 2009

The Stability of Eccentricity, the Volatility of Centrality

Index of Volatility

Index of Volatility for Selected Detroit Area Places, Pooled and Averaged by Category

Note: The Index of Volatility measures the magnitude of change in place-based voter turnout in election presidential primary preferences between consecutive elections. The Index for a specific place-time measurement is calculated by comparing the percentage of presidential primary preference for the two elections. The percentage primary preference is reported as the percentage of total primary vote for each candidate in the election. The Index of Volatility is always between 0 and 100. The Index of Volatility is always between 0 and 100. The Index of Volatility is always between 0 and 100. The Index of Volatility is always between 0 and 100.

The Index of Volatility between presidential elections 1 and 2 for a place is represented by the following formula:

$$\sqrt{((X_{\text{year } \% D} - X_{\text{year } \% R}) - (Y_{\text{year } \% D} - Y_{\text{year } \% R}))^2}$$

The two large figure shows the election in election (1960-1964, ..., 2004-2008) Index of Volatility levels for places by category. The large figure shows the election in election (1960-1964, ..., 2004-2008) Index of Volatility levels for places by category. The large figure shows the election in election (1960-1964, ..., 2004-2008) Index of Volatility levels for places by category. The large figure shows the election in election (1960-1964, ..., 2004-2008) Index of Volatility levels for places by category.

Pooled Index of Potential Effective Volatility, State Base

Totals for Organizational elections calculated (1960-1964....) Index of Personal Effective Voluntary Spurns for Characteristic groups, who are presented when no more have been pooled by category, measured aggregate elections. Totals for Organizational Spurns averaged over all of the elections.

Index of Difference for Selected Detroit Area Places, By Category, in
Relation to the Detroit Region Tri-County Area and the State of Michigan

Pooled Index of Difference

Figures show total and Olfaction score for Dorsal and Glom. Glom. are pooled by row respective epiglottical categories and averaged by row respective epiglottical categories, as compared to normal for *A. heligolae*.
